BUREAU

FEBRUARY 1937

TEMPERATURE

On Vancouver Island and along the inner channel the mean temperature was two or three degrees below normal. In the Fraser, Thompson, Nicola, Okanagan, Similkameen and Kettle valleys mean temperatures were four to eight degrees below normal. In the southern part of the East and West Kootenay valleys temperatures were only two or three degrees below normal but in the northern portion four to seven degrees below normal. In the extreme northwestern portion of British Columbia temperatures were above normal.

In the southern portion of the Peace River country and generally in the foothill region of Alberta temperatures were four degrees or more below normal. In that portion of Alberta between the north and south branches of the Saskatchewan River temperatures were slightly above normal.

In the extreme southwestern portion of Saskatchewan temperatures were two to four degrees below normal but elsewhere over the cultivated region of Saskatchewan mean temperatures averaged nearly normal.

In southern Manitoba normal temperatures were exceeded by two degrees and in the lake region by four to six degrees while in the extreme northern portion of the province, along the Nelson and Churchill Rivers, the excess over normal temperature was six to eight degrees.

In Ontario normal temperatures were exceeded by eight to twelve degrees in the region from the Georgian Bay to James Bay and westward to Lake Superior. In the region of the Lake of the Woods and the Rainy River the normal temperature was exceeded by two to four degrees. In the Lower Lake Region the excess over normal temperature was generally five to seven degrees.

Along the St. Lawrence River from Montreal to the mouth of the Saguenay mean temperatures were exceeded by seven to eight degrees for the most part although a few localities reported excesses of nine degrees. In the region of Lake St. John and the greater part of the region north of the Ottawa and St. Lawrence Rivers as far as James Bay mean temperatures were exceeded by eight to eleven degrees. In the Gaspé Peninsula the excess over normal temperature was four to ten degrees; on the Island of Anticosti six degrees; on the Magdalen Islands two degrees; along the north shore of the Gulf eight to twelve degrees.

On the east coast of New Brunswick normal temperatures were exceeded by three or four degrees but over the greater part of the interior as well as on the Bay of Fundy shore the excess was five to seven degrees.

In Nova Scotia along the Bay of Fundy the excess over normal temperature was five to seven degrees; on the outer coast four degrees; on Cape Breton Island five degrees.

On the northwestern portion of Prince Edward Island the excess was three degrees, elsewhere five degrees.

In western Newfoundland mean temperatures exceeded the normal by four degrees. On the east coast the excess was five or six degrees.

In the northern portion of the Yukon Territory temperatures were two degrees below normal but in the southern portion two to four degrees above normal. At the mouth of the Mackenzie River temperatures were four degrees below normal but in the upper Mackenzie valley one to three degrees above normal. Eastward from Great Bear and Great Slave Lakes to Hudson Bay the excess over normal was about three degrees. Along the southern portion of the west coast of Hudson Bay the excess over normal temperature was six to ten degrees while along Hudson Strait the excess was four to six degrees, increasing towards the westward.

PRECIPITATION

In British Columbia precipitation was well above the normal amount except on the northern portion of Vancouver Island and along the outer coast of the mainland where the deficiency was only five to ten per cent. and in the extreme northern portion of the interior where the deficiency was about seventy-five per cent. On the southern portion of Vancouver Island the excess was generally sixty to seventy per cent. but along the inner coast of the mainland, the lower Fraser valley and Burrard Inlet only thirty-five to fifty per cent. In the Okanagan valley and over a large part of the Kettle and Kootenay valleys the precipitation was exceptionally heavy with excesses ranging from two hundred to nearly five hundred per cent. of the normal amount. In the Similkameen and Nicola valleys the excess ranged from fifty-five to two hundred per cent. and generally averaged about one hundred and twenty-five per cent. In the north and south Thompson valleys the excesses ranged from one hundred and thirty to more than three hundred per cent. In the northern portion of the Selkirk and Monashee Mountains the excess was generally more than one hundred per cent. but from the Yellowhead Pass, across the interior plateau, and the headwaters of the Fraser River there was a deficiency of about thirty-five per cent. For the southern portion of British Columbia this was the snowiest February in twenty years.

In Alberta around the headwaters of the Red Deer River precipitation was in excess by about one hundred per cent. but elsewhere in Alberta precipitation was generally deficient. The deficiency in the Peace River and Lesser Slave Lake country was about forty-five per cent. and along the north branch of the Saskatchewan River eighty per cent. or more. Southeastward from the Bow River to the Rocky Mountains the deficiency varied greatly with locality, ranging from ten to seventy per cent along the Bow River and from five to eighty-five per cent. in the southwestern foothills. On that portion of the plains lying between the north and south branches of the Saskatchewan River there were local excesses, the amount generally averaging about normal in that district.

In Saskatchewan precipitation was about seventy per cent. in excess of the normal amount from the confluence of the north and south branches of the Saskatchewan River southwestward two hundred and fifty miles. Elsewhere in Saskatchewan precipitation was below normal except in the region of the Cypress Hills. The deficiency in the northwestern portion of the grain region was about twenty per cent. Along the main line of the C.P.R. and southward to the International Boundary the deficiency averaged about twenty-five per cent. although locally it amounted to eighty-five per cent.

In Manitoba precipitation was generally in excess of normal. The excess averaged about fifty per cent. over the wheat region but there were local deficiencies of ten to forty-five per cent. around the headwaters of the Souris River.

Over the greater part of Ontario precipitation was well in excess of the normal amount. From the northwestern shore of Lake Superior westward to the Lake of the Woods the excess averaged fifty-five per cent. although locally more than twice the normal amount was reported and at Port Arthur approximately five times the normal amount. Along the northeastern shore of Lake Superior the excess averaged one hundred and thirty per cent. On the north shore of Georgian Bay northward to James Bay precipitation varied locally from a deficiency of ten per cent. to excesses of one hundred to one hundred and fifty per cent. The general average was an excess of about sixty per cent. Along the shore of Lake Erie and that part of the Lake Huron shore from Sarnia to Southampton there was a deficiency of about twenty-five per cent. Along the shore of Lake Ontario and along the upper portion of the St. Lawrence River there were deficiencies ranging from ten to fifty per cent. Over the highlands between the Lower Lakes and from the eastern shore of Georgian Bay eastward to the lower Ottawa River the excess was about thirty-five per cent. Along the upper Ottawa River and the lower portion of Lake Temiskaming there was a deficiency of about fifteen per cent.

In Quebec around Lake St. John, along the Saguenay River, and along the lower St. Lawrence below Quebec to Father Point, precipitation was in excess by forty per cent. Along the middle St. Lawrence from Montreal to Quebec both excess and deficiency were reported. South of the river to the boundary of the State of Maine there was a general excess of about thirty per cent. but north of the river towards the headwaters of the Gatineau and the St. Maurice, although there were local excesses, small deficiencies of five to twenty per cent. predominated. From the north shore of the Gaspé Peninsula to the Island of Anticosti there was a deficiency of forty-five per cent. but in the southern portion of the Gaspé Peninsula around the Bay of Chaleur there was an excess of forty-five per cent.

Along the eastern coast of New Brunswick to the north shore of the Basin of Minas in Nova Scotia there was an excess of thirty per cent. Over the remainder of New Brunswick, Nova Scotia, as well as on Prince Edward Island precipitation was deficient. In the interior of New Brunswick the deficiency was generally about twenty per cent. but along the north shore of the Bay of Fundy the deficiency ranged from twenty-five to fifty-five per cent. In the extreme southwestern portion of Nova Scotia the deficiency was fifty-five per cent. and elsewhere averaged about twenty per cent.

In Newfoundland and the Magdalen Islands there was a deficiency of fifty per cent. except at St. John's where there was an excess of fifteen per cent.

Along the Mackenzie valley and in the Yukon Territory there was a general deficiency of about seventy per cent.

Over the Hudson Bay region eastward to the entrance of Hudson Strait there was a deficiency which, from the small amount of data yet available, appears to have been in the neighbourhood of twenty per cent.

A. J. CONNOR

SPECIAL REPORTS

NOTE—Column H is Highest Temperature; Column L is Lowest Temperature; Column Tm is the mean temperature of the month; Column P is Precipitation in inches; Column I denotes total of bright sunshine in hours during the month; Column Sg. denotes depth of snow on ground in inches, where given.
